The Netherlands

The Hague

12 September 2007
Preface

This action plan is the implementation of the Netherlands of the requirement in article 14.1 of Directive 2006/32/EC of 5 April 2006 on energy end-use efficiency and energy services, stating that Member States shall submit to the Commission an energy efficiency action plan (EEAP).

The action plan contains a description of measures to improve the energy efficiency in the Netherlands that are planned to achieve the indicative targets for 2010 and 2016, and to comply with the requirements regarding the exemplary role of the public sector and information and advice to final customers.

In 2011 a second EEAP will be submitted as required in the directive.

1 Summary

The table below summarizes the expected savings of the measures taken in the framework of the Netherlands Energy Efficiency Action Plan and provides indicative targets for 2016 and 2010. The expected savings per sector are calculated for the package of measures applied to that sector; no savings per measure are calculated. Given the connection between the measures, such a calculation is not feasible. Furthermore a range (low – high) is given for the expected savings. The minimal value for energy savings, slightly above the target, implies the lowest estimate for effects of EU-policies as well as national policies. The difference between lowest and highest value depends for about two-thirds on success for EU-policy and for about one-third on success for national policy. If the contribution of renewables-behind-the-meter is omitted the minimal value is equal to the target.

Measures to implement Article 5 on the public sector:

Within Europe, the Netherlands is a frontrunner when it comes to sustainable procurement. It has been agreed upon in the government that in 2010 100% of central governmental procurement will take sustainability (including energy efficiency) criteria into account. For regional and local government, this percentage will be at least 50%. In the programme Sustainable Operational Management for Governments (DBO)
criteria on sustainable procurement are developed and dissemination activities are carried out.

The Dutch government will make agreements with local authorities to reduce carbon dioxide. These agreements will also contain sections on energy efficiency.

The buildings of the national government will be climate neutral from 2012 on. This will be done by firstly, increasing energy efficiency and the use of renewable energy. The remaining emissions will be compensated for.

The exemplary role of the central government will also be undertaken by acting as ‘launching customer’. Government will apply innovative energy concepts in housing and mobility. Through its buying volume, the government can give a strong impetus to the development of innovative concepts, products and services.

Measures to implement Article 7 on availability of information:

In the Netherlands three organisations disseminate reliable information on energy efficiency: one organisation targeted on consumers (MilieuCentraal), one on SMEs (Energiecentrum MKB) and one for other market parties. Furthermore many NGOs and companies are active in this field. Due to the increased attention to energy efficiency in Dutch policy the next years will show an increasing number of opportunities to show market parties the possibilities of energy efficiency.

In accordance with the directive best practices regarding energy efficiency are exchanged and disseminated widely. To that end The Netherlands participates in various international energy (efficiency) networks.

Average over 5-year period 568.777 GWh
9% energy saving target in 2016 51.190 GWh
Energy saving target adopted 51.190 GWh
Intermediate target in 2010 adopted 11.376 GWh

Annex I contains a detailed calculation.

---

1 Energy use of armed forces not included.
2.2 Specific aspects in the calculation of the national target

2.2.1 Specific aspects in the calculation of the national target

For the calculation of the final inland energy consumption the energy statistics of CBS (Statistics Netherlands) are used. These figures are processed in the MONIT-system (Monitoring Of National use, Information and Trend analysis) of ECN².

2.2.2 Interface with the sectors covered by the ET Directive and military use

In the period 2008-2012 some 350 Dutch companies are participating in the European system of CO₂-emissions trading (EU-ETS), of which about 250 final consumers of energy. The other 100 companies are part of the energy supply (or transformation) sector (power plants, oil and gasproduction companies and refineries). The group of final consumers of energy who take part in EU-ETS has the following composition:

- Industry: about 175 companies
- Agriculture: more than 60 companies
- Tertiary sector: more than 10 companies
- Residential sector: 0
- Transport sector: 0

The ESD end-use is calculated by substracting the final energy use of the EU-ETS companies from the final energy use of the 5 above mentioned sector as a whole. The calculation of the ESD target for the Netherlands is based on the average ESD end-use in de period 2001-2005.

First the possibility is investigated if the deduction for EU-ETS could also be based on CBS data. Several problems arose that had to do with the aggregation level of the available information and the fact that part of the information is based on sampling.

Because of these problems the correction for the EU-ETS companies are based on the available information at SenterNovem from the process of CO₂-allocation 2008-2012. It was necessary to correct and supplement these figures for three reasons:

- Using the harmonized EU definition of incineration plants not all incineration plants of EU-ETS companies come in EU-ETS. Therefore the non-EU ETS figures were completed with an estimate of the incineration plants that do not come in EU-ETS.
- Not for all EU-ETS companies figures on electricity consumption were available. Estimates based on monitoring data from Long-term Agreements (LTA) and environmental year reports were used to complement the figures.

---

• No figures were available on the purchase of heat. The total consumption of heat in industry was estimated using the output of industrial CHP installations. 95% of the amount was attributed to EU-ETS companies.

The CBS energy data does not contain energy consumption data of the armed forces; therefore no correction regarding this aspect was needed.

2.2.3 Conversion factors

In the calculations for the savings in chapter 3 the electricity saved at end-users is converted to primary energy. The savings are the combined effects of existing and new policies. The effects of existing policies are based on an earlier outlook that provided figures on CO₂ emission reductions due to policy measures. These figures have been converted to primary energy savings, using CO₂-factors that imply a conversion factor for electricity in the order of 2.5, but which however is not known exactly. The effects of new policies are calculated using the primary energy savings for 2011 and 2020 from the ex-ante evaluation for the work programme “Schoon en Zuinig” (Clean and Efficient). The interpolation to the target years 2010 and 2016 implies a slightly diverging conversion factor, in the range of 2.2 - 2.3. Due to using processed results of available ex-ante evaluations it is not possible to state the exact overall conversion factor for electricity. However, given the outcomes of the EEAP, the exact value for the conversion factor will not influence the main results of the EEAP for the Netherlands.

2.2.4 Definition of the boundary between final inland consumption and the supply (or transformation) sector

In the final inland consumption power stations (including decentralised CHP), extraction companies and refineries were not taken into account because they are part of the energy production sector. Furthermore most of these companies come in EU-ETS.

Delivery of heat to the residential, tertiary and agricultural sectors is included in the final inland consumption.

Regarding the industrial sector 95% of the heat of decentralized CHP plants (independent installations) in contributed to EU-ETS companies and therefore substracted from the final consumption of the industrial sector. If a CHP plant is part of a company, the gas used for the CHP is contributed to the company, not the heat and electricity produced.
3 Sectoral presentation of energy efficiency measures

3.1 Introduction

This chapter contains a sectoral presentation of the savings as a result of the implementation of various packages of measures. These measures include both current policies and new, yet to be implemented policies. Savings from Early Actions are not included. This introduction provides some background to the calculation of the savings.

The savings due to existing policies are calculated using a reference scenario and a variant without policies. The savings are calculated as the difference between the scenario with existing policies and the variant without policy. However, the results are in Mton CO₂ reduced and need to be converted into primary energy saved with a CO₂ emission factor. Different emission factors are used for the residential and tertiary sector (gas and electricity), industry and agriculture (weighted factor for gas and electricity), transport (fuels).

The savings due to new policies are based on scenario calculations for the national work programme “Schoon en Zuinig”. Savings are in primary energy but for the years 2011 and 2020. Therefore the results from the calculations for 2011 and 2020 are by interpolation converted to savings for 2010 and 2016, taking into account when measures will become effective. E.g. the implementation of standards has only effect on new products, whereas the effect of an energy tax is considered to be immediate. Furthermore, also savings due to the implementation of renewables „behind the meter“ are taken into account.

The saving results are specified per sector and specific energy uses, e.g. new dwellings or appliances. The results often have been calculated for packages of policy measures; therefore no saving effects per separate policy measure are shown generally.

3.2 Energy efficiency improvement measures in the residential sector

Table 3.1 provides an overview of savings by application in the residential sector due to a package of measures.

---

3 For more details see e.g.: Dril, A.W.N. van; Elzenga, H.E.; Reference Projections Energy and Emissions 2005-2020, ECN, NMP, 2005

The energy policy for the residential sector is characterized by a set of instruments targeted at various aspects of residential energy use. This package of instruments aims to increase the awareness, to provide insight in self-regulation, to stimulate homeowners to take measures to improve the efficiency of their houses and contains regulation for new houses. Appendix II contains a description of the measures.

### 3.3 Energy efficiency improvement measures in the tertiary sector

The table below offers an overview of savings by application in the tertiary sector due to a package of measures.

Table 3.2 Overview savings tertiary sector

<table>
<thead>
<tr>

<td>Tertiary sector</td>
<td>2008-2016</td>
<td>1.515</td>
<td>9.112</td>
<td>15.499</td>
</tr>
</tbody>
</table>

For the tertiary sector the package contains regulatory standards for new buildings, regulation concerning environmental and energy management, energy tax, long term agreements and benchmarking covenants, and subsidies that make investing in energy efficiency measures more profitable. Appendix II contains a description of the measures.

### 3.4 Energy efficiency improvement measures in the industry (non-ETS)

The table below offers an overview of savings in the industry (non-ETS) sector due to a package of measures.

Table 3.3 Overview savings industry (non-ETS)

<table>
<thead>
<tr>

<tr>
<td>1</td>
<td>Industry</td>
<td>2008-2016</td>
<td>249</td>
<td>636</td>
<td>1.778</td>
</tr>
</tbody>
</table>
The package contains regulation, voluntary measures, taxes and subsidies. The Environmental Protection Act contains the minimum obligations with which companies must comply, while additional efforts are agreed upon via the Long-term Agreements and the Benchmarking Agreement. The Energy Investment Deduction makes investments in energy efficient equipment and/or processes more cost-effective sooner, while the Energy Tax increases the cost price of energy. The Environmental Quality Electricity Production (Dutch: MEP) was broadened and optimised; there will be a MEP for wind on sea and on land, and for biomass. Appendix II contains a description of the measures.

3.5 Energy efficiency improvement measures in the transport sector

The table below offers an overview of savings by application in the transport sector due to a package of measures.

Table 3.4 Overview savings transport sector

<table>
<thead>
<tr>
<th>No</th>

<td>5.293</td>
</tr>
</tbody>
</table>

The package for the transport sector contains the following measures:

- Taxes: fuel taxes (including taxation of motor fuels which are harmful to the environment), motor vehicle tax (Dutch: MRB) and private motor vehicle and motorcycle tax (Dutch: BPM), surcharge levy per kilometre, CO₂-differentiation BPM, tax discount for most efficient leased cars.
- Long term agreements
- Limiting maximum speed
- Energy labelling of cars
- ‘Eco driving’ programme
- Subsidy schemes
- Longer and heavier lorries

Appendix II contains a description of the measures.

3.6 Energy efficiency improvement measures in agriculture

The table below offers an overview of savings in the agricultural sector due to a package of measures.

</table>

The package contains the following measures: Long term agreements, subsidy schemes, e.g. for CHP and renewables, energy tax, Energy Investment Deduction, the programme 'Kas als energiebron'\(^4\), Green Funds Scheme and Financing (MIA, Vamil), and an internal emission trading scheme for the greenhouse sector. Appendix II contains a description of the measures.

\(^4\) Greenhouse as energy source.
4 Horizontal and cross-sectoral measures

Several measures in this action plan relate to more than one sector (see table below).

The savings for horizontal and cross-sectoral measures are allocated in the relevant sectors.
5 Measures related to article 5 and 7 ESD

5.1 Article 5: Energy efficiency measures in the public sector

The ESD (Article 5) requires the public sector to play an exemplary role in meeting the energy saving target set out in Chapter 2. The policies and measures underway and already in place to fulfil this requirement are detailed below.

Sustainable public procurement

Within Europe, the Netherlands is a frontrunner when it comes to sustainable procurement. It has been agreed upon in the government that in 2010 100% of central governmental procurement will take sustainability (including energy efficiency) criteria into account (Kamerbrief van 14 juli 2006 van de Staatssecretaris van Volkshuisvesting, Ruimtelijke Ordening en Milieubeheer (Kamerstukken II 2005/2006, 30 300 XI, nr. 134)). For regional and local government, this percentage will be 50%, but currently negotiations between national and local governments are taking place with the aim to raise the percentage.

In the programme Sustainable Operational Management for Governments (DBO) criteria on sustainable procurement are developed. Energy efficiency will often be an important part of the criteria. By the end of 2010, criteria for 80 to 100 product groups will have been developed. The programme is jointly operated by the national government and the representative organisations of regional and local government. Progress of the programme will be monitored biannually. The website www.senternovem.nl/duurzaaminkopen contains all information about the programme and criteria. The website is also an important tool to disseminate knowledge on energy efficient procurement, together with conferences, workshops, newsletters and other activities, undertaken by DBO and other organisations working on public procurement.

Local agreements

Furthermore, the Dutch government will make agreements with local authorities to reduce carbon dioxide. These agreements will contain various aspects, like 2% energy efficiency improvement in buildings, 1.5% energy efficiency improvements considering public lighting, renewable energy, etc. and subsidy schemes.

Climate neutral government

The buildings of the national government will be climate neutral from 2012 on. This will be done by firstly, increasing energy efficiency and the use of renewable energy. The remaining emissions will be compensated for. So far, 19 local governments have ambitious plans to become climate neutral cities between 2015-2020. Apart from their own building stock, mobility and operational management, they will stimulate energy efficiency and renewables in households and commercial companies. This number is expected to increase, also as a result of the above mentioned agreements.
Furthermore, government plans to install energy efficient lighting in public space at increased speed.

**Government as Launching Customer**

The exemplary role of the central government will also be undertaken by acting as ‘launching customer’. Government will apply innovative energy concepts in housing and mobility. Through its buying volume, the government can give a strong impetus to the development of innovative concepts, products and services. The website of the initiative can be found on www.launchingcustomer.ez.nl.

Through the combination of these measures, the Dutch government fulfills the obligations under article 5 of the ESD. The focus lies on items b and c of Annex VI of this directive, but the Dutch government also contributes to the other items of Annex VI.

**5.2 Article 7: Availability of information**

MilieuCentraal (www.milieucentraal.nl) is an organisation offering consumers practical and reliable information on environmental items, including energy efficiency. The information is validated by independent experts. The Energiecentrum MKB is an independent foundation offering information on energy efficiency measures to SMEs. The financial and juridical frameworks adopted to achieve the indicative target values in most cases are disseminated by SenterNovem. Implementing programmes of the government, mostly carried out by SenterNovem, are aimed at specific stakeholder groups to provide them with information on energy efficiency. In this way the availability of information and advice to end-users is ensured.

Since the Balkenende IV government took office the attention for energy efficiency in the Netherlands has increased. The next years will show even more attention to dissemination of the possibilities for energy efficiency measures to stakeholders.

In accordance with the directive best practices regarding energy efficiency are exchanged and disseminated widely. To that end The Netherlands participate in various international energy (efficiency) networks, e.g. the European Energy Network (EnR) and various Implementing Agreements of the International Energy Agency (IEA), e.g. Energy Conservation in Buildings and Community Systems Programme (ECBCS), Demand Side Management (DSM) and the Working Party on Energy End-Use Technologies.

Annex II

Description of measures

II.1 Cross sectoral measures

The following measures apply to at least 4 sectors:

- Energy Tax (all sectors)
- Energy Investment Deduction (all sectors)
- Long-term Agreements and Benchmarking Agreement (Tertiary, Industry, Transport and Agriculture)
**Name** | **Energy Tax**
---|---
**Category** | 3.2 Tax rebates and other taxes reducing energy end-use consumption.
**Regional application** | The Netherlands
**Target group** | All end users that fall within the scope of the Energy Service Directive (ESD)
**End-use EEI action targeted** | Changing behaviour (saving energy) and investing in energy saving measures
**Status of implementation and planning** | Implemented. Introduced on 1 January 1996 as the Regulating Energy Tax (RET).

**Description**

The Energy Tax (ET) is a levy on energy consumption. The effect of ET is that it improves the yield of measures focussed on energy saving and regeneration of energy. The levy imposed on the consumption of energy makes energy saving more attractive (by changing behaviour or by investing in energy-saving measures). Investments earlier become more cost-effective by applying energy-saving techniques. The price elasticity (the extent to which consumption responds to a price change) of the ET is low and it varies from – 0.1 to – 0.25 in the short term. In the long term the elasticity is higher by changing the investing behaviour.

The energy tax is levied on:
- Electricity
- Natural gas
- Gas oil
- Semi-fluid oil
- Liquefied petroleum gas (LPG)

**Residential sector**

Since 2004 the level of the ET is dependent upon the energy consumption of the customer: the lower the consumption, the lower the Energy Tax. However, the ET per kWh electricity or m³ gas is much larger for small consumers than for large consumers. As a consequence, the ET has lead to a considerable increase of energy prices for small consumers⁵ and to a lesser extent for the large consumers. The share of ET

---

⁵ Consumers with a consumption up to 5,000 m³ gas and/or 10,000 kWh.
levied on natural gas and electricity prices at small consumers was approximately 30% more in 2006.

The 2004 Evaluation of Climate Policies in the Building Sector states that the effect per household is small. However, there is a relatively large contribution as a result of wider application.

The energy supplier charges the energy tax. The revenue of the energy tax is channelled back to the taxpayer through a decrease in the wages and income tax.

The Energy Tax is a regulation imposed by the Ministry of Finance. The energy companies collect the tax.

**Industrial sector (non-ETS)**

The non-ETS industrial sector pays higher prices for natural gas and electricity compared to the energy intensive industries (which do fall under emission trading). With a natural gas consumption of up to 6 million m$^3$ per year$^6$ the ET rate varies between 1 and 11 cent/m$^3$. Translated into €/GJp, the non-trading companies pay between 9 and 14 €/GJp for their natural gas of which 1 to 4 €/GJp is energy tax.

**Agriculture**

The energy tax (ET) applies a lower rate for glasshouse horticulture, flower bulbs and mushroom sectors (in any case until 2008). This measure allows these industries to enjoy the same benefits as the energy-intensive giant consumers.

---

$^6$ The cut-off between trading and non-trading companies is at a thermal input capacity of 20 MW. At an operational time of 3,000 hours, this equals a natural gas consumption of nearly 7 million m$^3$ per year, and a natural gas bill of around €1.5 million.
### Description

Energy Investment Deduction[^7] (EID) is a tax rule that allows additional deductions on taxable profit. The EID can be requested for acquisition or production costs of energy efficient equipment and sustainable energy.

The EID recognises five areas of application: buildings, equipment and processes, CHP, transport and sustainable energy. The energy list determines which equipment qualifies for the EID.

Equipment that is listed in the energy list must comply with several criteria:

- The equipment or technique must be defined clearly and unequivocally.
- The applied technique must comply with the valid generic conservation standards or it has to be related to the use of sustainable energy sources or should be very desirable from a perspective of raising awareness. In principle, only those parts in the technique that are necessary for realising energy saving are included.
- The equipment must be applicable in a sufficient number of situations or in a sufficient number of companies.
- The energy-saving piece of equipment should be one that is not commonly used as yet in the Netherlands.

The energy lists are updated annually.

In addition to techniques in the energy list, there are generically defined energy-saving investments that can be considered for EID. With respect to the generically defined investments there is a requirement to state the energy saving per invested euro.

[^7]: Dutch: Energie-investeringsaftrek (EIA)

<table>

</tr>
</tbody>
</table>
A situation could arise in which an investment is related to a piece of equipment (or a part of it) that can be considered for both the EID and for other fiscal regulations (Accelerated Depreciation on Environmental Investments\textsuperscript{8} and/or Environmental Investment Deduction\textsuperscript{9}). It is not possible to use both EID and MIA for the same investment component. However, a combination of EID and VAMIL is permitted.

The list already contains several measures aimed at the built environment. It will be expanded (probably as of 1 January 2008) with more measures to make it more attractive for building owners to invest in energy saving measures.

The Energy Investment Deduction is a regulation of the Ministry of Finance and the Ministry of Economic Affairs. SenterNovem and the Tax Authorities implement the EID.

\textsuperscript{8} Dutch: VAMIL.
\textsuperscript{9} Dutch: MIA.
<table>
<thead>
<tr>
<th><strong>Name</strong></th>
<th>Long-Term Agreements (LTA) and Benchmarking Agreement</th>
</tr>
</thead>
</table>
| **Category** | 4. Voluntary agreements  
4.1 Industrial companies  
4.2 Commercial or institutional organisations |
| **Regional application** | The Netherlands |
| **Target group** | • Tertiary sector  
• Industry  
• Transport  
• Agriculture (glasshouse horticulture) |
| **End-use EEI action targeted** | Companies must draft plans for energy saving, implement these plans, and report about their progress. In addition, companies must set up an energy management system and monitor the consumption of energy. |
| **Status of implementation and planning** | A start was made in 1989 with the long-term agreements. In 1999 the Benchmarking Agreement was introduced for industrial companies consuming more than 0.5 PJ/a. Duration: LTA2 until 2013, Benchmarking agreement until 2012. |

**Description**

**Long Term Agreements (LTA)**

Since 1992, within the framework of its energy saving policy, the government has been making long-term agreements\(^\text{10}\) (LTA) with a large number of sectors for improving energy efficiency. In 2000 the first series of LTAs for the industrial sector were concluded successfully. The period between 1989 and 2000 saw an average improvement of 22.3% in efficiency.

At the present time there are several types of long-term agreements running concurrently:

- LTAs with companies and organisations in the tertiary and transport sector.
- LTAs with companies in the agricultural sector.
- LTA2, which are called the second generation of long-term agreements, with enterprises that have energy consumption of up to 0.5 PJ per year. Companies with higher energy consumption are required in principle to join the Energy

\(^{10}\) Dutch: Meerjarenafspraken (MJA).
Efficiency Benchmarking Covenant (unless they can substantiate that their participation in the LTA2 is more useful).

The first series of LTAs and LTA2 are distinguished by a number of clear differences:

- The LTAs are concluded with sectors while the LTA2 are concluded with individual companies, sectors and Competent Authorities.
- In addition to energy efficiency, LTA2 also focuses on Expansion Themes: Energy Efficiency Product Development (EEPD), sustainable energy (SE) and Sustainable Chains and Energy Saving\textsuperscript{11}.
- LTA2 is closely linked to the provisioning of environmental permits (see Environmental Protection Act).

The LTA2 has a term of twelve years, divided into four-year periods. A company that joins is committed to the following:

- Every four years, companies draft an Energy Conservation Plan (ECP), in consultation with the Competent Authority, which sets out the energy efficiency goals of each company, linked to concrete measures and an implementation plan. The ECP defines which feasible measures shall be taken and which expansion theme the company shall undertake.
- Companies are obliged to implement so-called "good housekeeping" savings measures. These are process efficiency measures that are financially profitable for companies (the costs can be recouped in less than five years).
- To the extent possible, a list of measurements is formulated per associated LTA sector. Companies then carry out the feasible energy-efficient measures mentioned in the list.
- Based on all ECPs in the sector, a sector objective is determined. This is set down in a long-term plan (LTP).
- Participants in LTA2 are obliged to introduce systematic energy management (within three years of participation) into their companies. Energy management is intended to encourage companies to remain consistently focused on their energy consumption.
- Companies participating in LTA2 are obliged to strive to put the so-called expansion themes into practice. This involves working towards increasing the use of sustainable energy and saving energy through energy efficient product development.

\textsuperscript{11} Dutch: DKE.
• Participants in the LTA’s must submit yearly reports to the Competent Authority and SenterNovem on the progress they have made with implementing the Long-Term Agreements.

The effect of the LTA as an instrument is related to the use of the Environmental Protection Act as an instrument: the LTA has a stimulating function and the Environmental Protection Act regulates the minimal obligations.

Intensification and renewal of the LTAs are important components of the Dutch policy for improvement of energy efficiency. For the new agreements that will take effect in 2012 the following goals are being considered:

• An average improvement of energy efficiency of 20% inside the companies in 2020 compared to 2005 levels.
• Additional energy savings outside the companies of 10% over the same period (this includes renewable energy).
• Strategic studies for each industry sector that give an overview of possible savings, CO2 reduction and renewable technologies, as well as long term scenarios. These studies should aim for a 50% reduction in 2030.

The LTA schedule is carried out under the commission of the Ministry of Economic Affairs and the Ministry for Housing, Spatial Planning and the Environment, the Ministry of Agriculture, Nature and Food Quality and the Ministry of Transport, Public Works and Water Management. SenterNovem facilitates implementation.

Tertiary sector

Long-Term Agreements about energy efficiency have been concluded with various sub-sectors in the trade, service provision and government sectors. This concerns the science sector, higher professional training sector, banks and insurers, supermarkets and university medical centres (UMCs).

Industrial sector

The long-term agreements that were made with the various industrial sectors could play an important role in raising awareness about the options for energy saving as well as its benefits. By increasing the knowledge about the possibilities, the LTA2 could contribute to more economic-rational decision-making about energy efficient techniques.

Transport sector

A LTA in the transport sector was concluded with the Nederlandse Spoorwegen (Dutch Railways).

Agriculture

The flower bulb and the mushroom sectors have concluded new long-term agreements for the period of 2007 to 2011. In the framework of these sector-specific LTAs, the
following instruments are used: research, innovation vouchers, information as well as
demonstration and knowledge transfer. Therefore, the instruments are also intertwined.
Since the flower bulbs and the mushroom industries have signed a LTA, they benefit
from the energy tax measure.

The Glasshouse Horticulture and Environmental Covenant (GLAMI, broader than
energy) is applicable to glasshouse growers. The GLAMI expires in 2010. The rigid
energy standards will be replaced by a more flexible CO₂ settlement system.

The Glasshouse Horticulture Order in Council¹² is an interpretation of the GLAMI
covenant into legislation. The rules concern around 100 standards for various crops
and it is expressed in decreasing primary energy consumption per hectare of
glasshouse.

There is no LTA for the primary animal sector.

**Benchmarking Agreement**

After the first LTA (1999) for the industrial sector there was a need for the industry to
compare themselves, their individual processes, with the worldleaders in energy
efficiency. The incentive was and still is to make maximum efforts to consume energy
more efficiently, yet without compromising their international competitiveness.

The participating companies ( >0,5PJ/a) have to set the world toplevel themselves with
help of an independent consultant, by means of an international benchmark. They will
compare their processing plants in the Netherlands with similar plants abroad. The
Dutch plants will need to individually measure themselves against the average energy
efficiency of the best region in the world or with the best 10 percent of the globally
structured installations (excluding those in the Netherlands). When defining the world
leaders, account will also be taken of the anticipated efficiency improvements up to
2012. Companies indicate in an energy efficiency plan how and when the worldtop will
be reached. The world lead must be redefined every four years. Sofar the Dutch
industry has completed the first and second benchmarking round (benchmark

The Benchmarking schedule is carried out under the commission of the Ministry of
Economic Affairs and the Ministry for Housing, Regional Development and the
Environment.

¹² Dutch: AMvB.
II.2 Residential Sector

The energy policy for households is characterised by a combination of policy instruments that are focussed on the various aspects of household energy consumption. This combination of instruments is focussed on increasing the awareness about energy consumption, providing an insight into self-regulation, stimulating households into taking measures, and statutory measures for newly built housing.

- Energy Tax (see II.1)
- Building Decree and Energy Performance Standard (EPC)
- MilieuCentraal, COEN (Consumer & Energy) and HIER campaign
- TELI subsidy scheme
- KOMPAS
- Temporary subsidy scheme Buildings and CO₂ reduction
- Green Funds Scheme (Groen Beleggen)
- Expand green investment arrangements
- Meer met Minder (More with Less)¹³ plan
- Taskforce lighting (see II.3)
- Covenant housing corporations
- Heat distribution
- Enhancing effects implementation of Ecodesign directive

¹³ Not to be confused with the More with Less plan form the European Commission
<table>

</tr>
</tbody>
</table>
| **Status of implementation and planning** | 1995: Energy Performance Coefficient (EPC) = 1.4  
2000: Energy Performance Coefficient (EPC) = 1  
2007: Energy Performance Coefficient (EPC) = 0.8  
2011: EPC = 0.6  
2015: EPC = 0.4 |

**Description**

The current policy regarding new buildings is set down in the Building Decree and the Energy Performance Standard (EPC).

**Specific energy requirements for the building elements in the Building Decree**

The Building Decree specifically regulates the constructional requirements to which new buildings have to comply in the Netherlands. This also includes minimal demands with regard to insulation values of façades, floors and roof elements and requirements for installations (establishing standards on the level of components).

**Energy Performance Standard (EPC)**

The EPC sets up requirements regarding the energy performance of a house or (commercial) building. In the meantime the standard in the Building Decree has been tightened several times by which the maximum permitted energy performance coefficient (EPC) for newly built housing has been decreased from 1.4 in 1995 to 0.8 presently. As a result of these measures, newly built houses save an average of 30% in energy. The standards for utility building have also been made stricter.

**Additional tightening of the EPC**

Project developers and other parties to the project are obligated to take energy-saving measures in all new developments. Additional EPC measures could result in tightening the standard by 25% around 2012 and 50% around 2015 with respect to the current standard. Such stringent standards could mean that the EPC for buildings would shift to 0.4. If the EPC is 0.4 the energy consumption for space heating is comparable to the Passive house concept (15 kWh/m²).
**Name**  
MilieuCentraal, COEN and HIER campaign

| **Category** | 2.1 Focused information campaigns  
2.3 Information centres. |
| **Regional application** | The Netherlands |
| **Target group** | The consumer and intermediary organisations (municipalities) |
| **End-use EEI action targeted** | • Changing consumer behaviour.  
• Choosing energy-saving appliances. |
| **Status of implementation and planning** | Ongoing |

**Description**

MilieuCentraal, the COEN (Consumer & Energy) programme and the HIER campaign are implementing a number of instruments and activities that will bring the subject of energy saving to the attention of specific consumer target groups. COEN focuses on the intermediary organisations and MilieuCentraal and the HIER campaign on consumers.

MilieuCentraal is national and independent organisation that offers consumers practical and reliable information about the environment. A forum of independent experts tests that information. The organisation gets a government subsidy for carrying out part of its activities.

COEN is a programme fully financed by the government. The HIER campaign is partly financed by the government and partly by NGOs and private parties.

The following instruments are employed for bringing energy saving to the attention of consumers:

**Tailored energy advice**: The 'Energie op Maat' website provides interested consumers with tips and instructions on how to make their energy consumption more sustainable, cheaper and more environment-friendly.

**Television**: The TV programme Energy Survival presents games that engages children actively, using the theme of 'energy saving' combined with an interactive internet site. It is also geared indirectly towards their parents.

**Labelling on household appliances**: Providing information about the energy efficiency of appliances. The 'Energielabel.nl' website provides an overview of energy efficient household appliances and the energy labels used in the Netherlands.

---

14 Dutch: Energie op Maat (EoM).
Smart Light!: This project is aimed at replacing regular light bulbs with energy-saving light bulbs, including drives via municipalities.

HelpDesk for consumers: MilieuCentraal answers questions by telephone and via emails that are sent to the Helpdesk. In addition, MilieuCentraal initiates communication projects about important environmental issues, such as environment-friendly building, DIY, mobility and food.

Smart meters and feedback: In the coming years all households in the Netherlands will be equipped with smart meters that provide consumers with frequent feedback on energy consumption. The expectation is that in combination with information provision and awareness, this will result in a saving of approximately 2% on household energy consumption by realising a change in behaviour.

Hier\textsuperscript{15} (www.hier.nu) is the name of a large Dutch climate program whose fundamental idea it is to stress the immediate necessity to implement adaptation projects and initiatives to climate change. Hier introduces a new brand uniting and representing all initiatives that reduce the risk of climate change. This campaign involves not only >40 national charity organisations, but also government and businesses.

\textsuperscript{15} Dutch for 'Here'.
<table>
<thead>
<tr>

<td>The programme began in 2004.</td>
</tr>
</tbody>
</table>

**Description**

Kompas intends to facilitate measures so that parties and consumers will undertake their own activities and effect decisions that lead to a CO₂ reduction, including energy saving. Kompas supports municipalities, parties in the commercial and industrial building sector (such as schools and banks) and parties in the housing sector (such as housing corporations).

Kompas determines the most efficient strategy per party, which means employing a mix of instruments that are best suited. In order to attain a picture of the developments in energy saving in the buildings sector, Kompas monitors this aspect annually via user panels.
Name | Energy label and certificate for houses  
---|---  
Category | 2.2 Energy labelling scheme  
Regional application | The Netherlands  
Target group | House owners and tenants  
End-use EEI action targeted | Measures to improve energy efficiency of houses  
Status of implementation and planning | Starting 2008  

**Description**

The energy label and certificate for houses will be used to stimulate house owners and tenants to take measures to improve the energy efficiency of their houses. From 2008 on, an energy label will be compulsory at mutation moments (selling, renting out the building). This measure will be complemented by other measures, e.g. financial measures to remove barriers for investments by house owners (both private and corporate).
<table>
<thead>
<tr>
<th><strong>Name</strong></th>
<th>TELI subsidy scheme</th>
</tr>
</thead>
</table>
| **Category**  | 2.1 Focused information campaigns  
2.4 Energy audits |
| **Regional application** | The Netherlands |
| **Target group** | Local authorities, (energy) companies, housing corporations. |
| **End-use EEI action targeted** | Energy efficiency measures (including information campaigns) for low income households. |
| **Status of implementation and planning** | Scheme went into effect as of 1 January 2002; most recent tender was in 2006. |

**Description**

The TELI subsidy scheme\textsuperscript{16} aims to remove barriers for low income households with respect to energy efficiency measures, e.g. technical measures, advices and information for the rational use of energy. Low income households (i.e. households with a yearly income less than € 14,000) generally face two barriers: monetary (to pay even for small investments) and access to tailored information.

The scheme subsidizes projects carried out by e.g. local authorities, (energy) companies and housing corporations that give advice and information to low income households and carry out or provide technical measures, e.g. water saving shower heads, CFLs, piping insulation.

\textsuperscript{16} Dutch: Tijdelijke subsidieregeling energiebesparing huishoudens met lage inkomens.
**Name**  
Temporary subsidy scheme Buildings and CO2 reduction

**Category**  
3.1 Subsidies (Grants)

**Regional application**  
The Netherlands

**Target group**  
Housing corporations, private housing companies, investors and property developers.

**End-use EEI action targeted**  
Energy efficiency measures for improving energy efficiency of existing houses and commercial buildings.

**Status of implementation and planning**  
The scheme went into effect 27 July 2006

**Description**

The temporary subsidy scheme Buildings and CO2 reduction provides a subsidy up to 15% of the investment costs (with a maximum of €1 million per project) for technical measures in existing buildings to reduce energy consumption. The eligible measures should be chosen from a list and the subsidy depends on the (deemed) amount of CO2 saved. Possible measures include cavity, roof and wall insulation, solar hot water system, heat pump boiler and CHP installations.

</tr>
<tr>
<td>Status of implementation and planning</td>
<td>New EEI measure, process of implementation not started yet</td>
</tr>
</tbody>
</table>

**Description**

Green investments can be financed with special loans with lower interest rates. The Green mortgage is one of the available soft loans. When a dwelling meets the demands that were formulated in the rules for sustainable dwellings\(^{18}\), the owner can receive a discount of about 1 percent on the interest rate. In practice many project developers find the rules to demanding and the number of participants is therefore limited.

At the moment the possibilities to improve the arrangements are being studied. A taskforce with members from different departments made proposals for improvement. A committee, that among others contains financial institutions, did not take a position on the proposals. If they approve the proposals, they will be elaborated to become a part of the 2009 tax plan.

**End-use EEI action targeted**  
Stimulating both institutional and private home/building owners to take energy saving measures in existing buildings

**Status of implementation and planning**  
New EEI measure, process of implementation not started yet

### Description

The associations for the housing cooperatives (Aedes), for energy companies (EnergieNed), for the construction sector (Bouwend Nederland), for the installation sector (UNETO-VNI) and the Energy transition platform for the build environment (PeGO) proposed an action plan “More with Less”\(^\text{20}\) for energy savings in the build environment. This plan is a comprehensive collection of policy measures to achieve considerable energy savings in the built environment.

The plan will be implemented in covenants with the participating organisations. These agreements will formalize the different targets and intentions mentioned in the plan. The energy sector and other organizations commit themselves to execute the MmM-plan in the period 2008-2020. A MmM program board will be installed, which becomes responsible for the implementation of the plan.

The plan contains several components:

- Energy Central
- Remove barriers
- Change the housing assessment system for social housing
- Pilots energy saving for homeowners and private landlords in combination with district approach.

</tbody>
</table>

**Description**

Energy Central will become the executing office responsible for the implementation of the MmM-plan. It should become the central coordinator to facilitate the different actors. Several organization will contribute to Energy Central. It will carry out different tasks:

- Promotion of energy saving in buildings.
- General advise
- Monitoring and reporting the results on a yearly basis.
- Coordinate the different activities taken by real estate agents, constructors, banks, installers and energy companies and others.
**Name**

*MmM: Remove barriers for homeowners to invest in their dwelling*

**Category**

1. Focused information campaigns
2. Metering and informative billing
3. Subsidies
4. Soft loans

**Regional application**
The Netherlands

**Target group**
Private homeowners

**End-use EEI action targeted**
Inform homeowners about energy saving and financial benefits. Offer the financial means to invest in energy saving measures

**Status of implementation and planning**
New EEI measure, process of implementation not started yet

### Description

Although homeowners (both private and institutional) are aware of the necessity of energy saving, many barriers prevent homeowners to actually improve their own real estate. The implementation of the MmM-plan will put a lot of effort into the removal of these barriers.

Four types of barriers can be identified:

1. **Unawareness of the financial savings that can be made by energy saving.**
   This barrier must be removed by information campaigns.

2. **Uncertainty and distrust about the quantity of financial savings that will be achieved.**
   Certification and quality management can help to increase the confidence in the results of energy saving measures. Smart meters can help to inform the dweller on his present energy consumption. Energy companies should decrease the advance payment directly at the moment when energy saving measures are executed.

3. **The homeowner is unable to finance the necessary large investments in energy saving measures.**
   Banks should offer attractive financing programs and governments should set up supporting programs

4. **Refurbishing dwellings is too much effort**
   Information campaigns and support programs should focus on natural investment opportunities, especially when occupants move out. Energy saving measures could also be combined with district upgrading programs. Energy saving measures must be offered in combinations of easy and more difficult measures.
The MmM-plan will follow the following route to remove barriers: communication, awareness raising, advice, implementation and „after sales“ service. Facilities, e.g. personal advice and support, will be provided to consumers if:

- They at least implement 2 measures, of which one easy and one more difficult measure.
- The energy saving measures must lead to at least an improvement of two label categories\(^{21}\).
- The total energy saving package is cost effective.

The government will also financially stimulate homeowners to invest in energy efficiency. Until 2011, under this scheme, in 500,000 houses measures will be taken to make houses more energy efficient. From 2012 on, a number of 300,000 houses per year.

A subsidy for renewable options in existing buildings will be started (solar boilers, heat pumps and solar PV). This will lead to 100,000 existing buildings with RES in 2011.

\(^{21}\) Energy labels for existing buildings are obliged from January 2008 according to the EPBD directive.
**Name**

MmM: Change the housing assessment system for social housing

**Category**

1. regulation

**Regional application**

The Netherlands

**Target group**

Housing associations

**End-use EEI action targeted**

Enable to raise the rent for housing associations when investing in energy saving measures

**Status of implementation and planning**

New EEI measure, process of implementation not started yet

**Description**

In the Netherlands rental prices are regulated. Within the housing assessment system, points are awarded for quality aspect of dwellings, such as floor surface and facilities. The rental prices depend on the total number of points.

At present, implementing energy measures such as insulation is only limited rewarded. Investment in energy saving measures cannot be compensated by raising rental prices. Since the landlord cannot benefit from financial profit as a result from energy saving, it's not attractive to invest in energy saving.

If energy saving measures will receive more points in the future, housing associations can earn their investments back by raising rental prices.
Name | MmM: Pilots energy saving for homeowners and private landlords in combination with district approach
---|---
Category | 2.6 Demonstration projects
Regional application | The Netherlands
Target group | Low-income people
End-use EEI action targeted | Save energy through large scale refurbishment in low-class districts.
Status of implementation and planning | New EEI measure, process of implementation not started yet.

Description

In 2007 the Dutch government has initiated an approach to upgrade city districts that suffer from unemployment and crime, more than average. The minister of Housing, communities and integration, identified 40 districts which will be upgraded.

National and local governments will cooperate with local residents and social housing corporations to upgrade neighbourhoods. A physical upgrade or replacement of existing dwellings is one of the items in this plan.

Apart from the social improvements, energy saving will be an important issue in these districts. The districts contain a lot of poor quality dwellings, which are e.g. often badly insulated. As a result, the energy costs for the dwellers are high. Because of low incomes and limited access to loans, home-owners cannot invest in energy saving measures. Local authorities and housing corporations will invest in energy saving measures in these districts.
**Name**  
Covenant housing corporations  

**Category**  
4.2. Voluntary agreement with commercial and institutional Organisations  

**Regional application**  
The Netherlands  

**Target group**  
Housing associations  

**End-use EEI action targeted**  
Commit housing associations to make an effort to realize large scale energy savings in existing buildings.  

**Status of implementation and planning**  
New EEI measure, process of implementation not started yet.  

**Description**  

Housing corporations play a major role in Dutch housing. About 500 corporations possess 35% of the dwellings in the Netherlands. Since renters are not allowed to make major changes in their dwelling, energy saving measures must be executed by the corporations. They have the financial, technical and organizational means to implement saving measures on a large scale.

In their 2007 statement “Antwoord op de samenleving” (Answer to society) Aedes, the association for housing corporations, promises to save 20% on energy use in existing dwellings before 2018. Since their effort is crucial for the results in the residential sector, the government will fixate these promises in a covenant. Aedes elaborates the target in a plan which can be used as a basis for a covenant.
<table>

<td>Create fixed conditions under which heat distribution projects can be executed. This raises the attractiveness of heat distribution projects.</td>
</tr>
<tr>
<td>Status of implementation and planning</td>
<td>New EEI measure, process of implementation not started yet</td>
</tr>
</tbody>
</table>

**Description**

Heat distribution can be a sustainable and efficient way to suffice the heat demand of buildings. The government is willing to stimulate this. Since consumers depend on a single heat distributors, these organization act as monopolists. Energy companies are accused for charging too much for heat distribution. This has harmed the image of heat distribution and municipalities are reserved in starting up new projects. To handle this problem it is expected that the Dutch parliament will approve new legislation on heat distribution22 this year. This law dictates how organizations should operate when they manage heat distribution projects. Maximum tariffs and assurance of heat supply are the main issues in the legislation.

Apart from new legislation studies are being executed for measures to facilitate and stimulate heat distribution projects.

---

22 Dutch: Warmtewet.
**Name**  
Enhancing effects implementation of Ecodesign directive

**Category**  
1.2 Minimum Equipment Energy Performance Standards

**Regional application**  
The Netherlands

**Target group**  
Industry, SMEs

**End-use EEI action targeted**  
Develop strong standards for appliances, so newly bought appliances are much more energy efficient

**Status of implementation and planning**  
New EEI measure, process of implementation started.

**Description**

The Ecodesign directive became effective in August 2007. Energy and environmental standards will be formulated, to change the design of energy using products.

To prepare for (possible) implementation measures, 20 studies are carried out. These studies involve: Central heating boilers, hot water equipment, computers, imaging equipment (copiers, fax-machines, etc.), TV-sets, stand-by usage, power supplies and battery-chargers, office lighting, public lighting, domestic lighting, domestic air conditioners, electric motors, commercial and domestic refrigerators and freezers, washing machines, dishwashers, solid fuel heaters, dryers, vacuum cleaners and simple and complex set-top boxes. Every study for every appliance group will contain an environmental profile. These profiles will be used to select policy measures. It is very likely that energy efficiency standards will be part of all implementing measures.

The Dutch approach focuses on ambitious implementation measures that will lead to market changes, including:

- Enlarge the Dutch involvement in the European decision making process to accomplish stringent standards for the energy efficiency of appliances.

- Designers and manufacturers of (Semi-) products or parts will be stimulated if they comply with ecodesign standards earlier than necessary or if they exceed ecodesign standards. Additional funds will be made available in the existing Environment & technology program.

It is expected that at the end of 2008 implementing measures for all product groups will be proposed.
II.3 Tertiary Sector

In the tertiary sector the following combination of policy measures are applied:

- Energy Tax (see II.1)
- Energy Investment Deduction (see II.1)
- Long-term Agreements (see II.1)
- Energy Performance Standard (EPC) for public utility buildings and Energy Certificate (see II.2)
- Environmental Protection Act
- KOMPAS (see II.2)
- Temporary subsidy scheme Buildings and CO₂ reduction (see II.2)
- Green Investment Scheme (see II.2)
- Ecodesign directive for office appliances and public lighting (see II.2)
- Tasforce Lighting

The measures are a combination of statutory requirements for new developments (EPC), statutory requirements on environmental and energy management, taxes on the energy use, agreements about energy saving, and an incentive regulation that should make investing in energy saving measures more profitable.
Name  | Environmental Protection Act; environmental permits and orders in council (Dutch: AmvB’s)
--- | ---
Category  | 1.1 Building Codes and Enforcement
Regional application  | The Netherlands
Target group  | Companies
End-use EEI action targeted  | Regulations for industrial layout & equipment and operational management are set out in an environmental permit or orders in council. The frugal use of energy is also assessed in imposing the regulations.
Status of implementation and planning  | Implemented (since 1993).

Description

The Environmental Protection Act\(^ {23} \) (EPA) went into effect on March 1993. In specific terms the government uses the EPA to work towards an integral approach for environmental issues. The act outlines the statutory instruments that are available for protecting the environment and which basic assumptions are valid for these. In this context, the EPA requires companies to have an environmental permit. The permit must include requirements that ‘offer the environment the best possible protection’.

The government’s definition of ‘protection of the environment’ is in any case understood to mean:

- Improving the environment
- Effective removal of waste products
- Rational use of energy and raw materials
- Limiting traffic to and from the plant

This is known as a framework act: it contains the general rules for environmental management. More specific rules for certain groups are elaborated in decrees (Dutch: AmvB’s) and ministry regulations.

The companies that fall under an order in council could have an ‘additional requirement’ imposed by the municipality, that stipulates that the companies must undertake energy saving measures with a cost recovery period of five years or less.

The ministry for Housing, Spatial Planning and the Environment is responsible for enforcement. InfoMil, an information centre, informs the implementers about enforcing the act.

\(^ {23} \) Dutch: Wet milieubeheer (Wm)
<table>
<thead>
<tr>
<th><strong>Name</strong></th>
<th>Taskforce lighting</th>

<td>Develop, by cooperation between public an private parties, a policy to achieve major savings on public lighting</td>
</tr>
<tr>
<td><strong>Status of implementation and planning</strong></td>
<td>New EEI measure, process of implementation not started yet</td>
</tr>
</tbody>
</table>

**Description**

The taskforce on lighting is a cooperation between producers, retailers and users of lighting. The parties involved will enter into agreements to move towards the use of the most energy efficient lighting available; the agreements will be more ambitious than the implementing measures (minimum efficiency standards) under the Ecodesign directive. The task force will deal with public lighting (lighting on highways, regional and local roads, bridges and locks), commercial and residential lighting.

The taskforce will look at ways to expand existing policy measures such as the Energy Investment Deduction (a fiscal stimulation for enterprises), energy saving projects from the ministry of transport and Long Term Agreements with the industry and tertiary sector.

Apart from intensifying existing policies, the taskforce will develop attractive financial stimulation measure, track down and take away conflicting regulations and lock-in effects as a result of new technologies. The government will take the lead by using her purchase power.
II.4 Industry (Non-ETS)

In the industrial sector, with the exception of the part that falls under the European emission trading, the following measures are employed:

- Energy Tax (see II.1)
- Energy Investment Deduction (see II.1)
- Long-term Agreements and Benchmarking Agreement (see II.1)
- Environmental Protection Act (see II.3)
- Environmental Quality Electricity Production (Dutch: MEP) for Combined Heat and Power (CHP; Dutch: WKK)
- Energy Centre for SME (Dutch: Energiecentrum MKB)

The Environmental Protection Act contains the minimum obligations with which companies must comply, while additional efforts are agreed upon via the Long-term Agreements. The Energy Investment Deduction makes investments in energy efficient equipment and/or processes more cost-effective sooner, while the Energy Tax increases the cost price of energy. The Environmental Quality Electricity Production (Dutch: MEP) was broadened and optimised; there will be a MEP for wind on sea and on land, and for biomass.
**Name**
Environmental Quality Electricity Production (Dutch: MEP) for CHP (Dutch: WKK) and MEP for sustainable energy

**Category**
3.1 Subsidies (Grants)

**Regional application**
The Netherlands

**Target group**
Electricity producers

**End-use EEI action targeted**
Stimulating sustainable energy and the use of CHP.

**Status of implementation and planning**
The subsidy for sustainable generated electricity was stopped in 2006. A temporary regulation was implemented as an emergency measure. At this time an adapted version of the MEP is being prepared.

**Description**

Part of the electricity produced using CHP (about 30% of the production of an installation) or sustainable generated kWh (by wind, biomass, sun, hydropower) receives support from the government.

The subsidies for sustainable electricity and for electricity produced by CHP should compensate for the differences between the production costs related to sustainable electricity and for electricity produced by CHP and the market price for conventional electricity. The current subsidy scheme covers about 50% of the uneconomic part of the total costs.

The amount of subsidy varies according to the type of sustainable energy generation based on the difference between the production costs for sustainable electricity (wind, solar energy, etc.) and the market price for conventional electricity. The Minister for Economic Affairs decides annually on the level of the subsidies. The minister has the prerogative to distinguish between various production categories and various production installation categories.

The subsidy is then paid for maximum 10 years in the case of sustainable electricity and for 1 year in the case of CHP.

The higher level of subsidy for sustainable generated electricity was set to 0 in 2006. A temporary regulation was implemented as an emergency measure. At this time an adapted version of the MEP (for both sustainable energy and CHP) is being prepared.

The regulation falls under the responsibility of the Ministry of Economic Affairs.
Name | Energy Centre for SMEs  
--- | ---  
Category | 2.3 Information Centres  
Regional application | The Netherlands  
Target group | SMEs  
End-use EEI action targeted | Stimulating sustainable energy and the use of CHP.  
Status of implementation and planning | The activities of the Energy Centre run since 2002.  

**Description**

The Energy Centre for SMEs\(^{24}\) was founded in 2002. The mission of the Energy Centre is to stimulate energy savings in SMEs. To realize the mission the Energy Centre cooperates with associations, companies and other intermediaries. Activities include advice on energy efficiency measures, energy scan and helpdesk.

In the last 4 years 100,000 SMEs used the services of the Energy Centre and saved an amount of energy worth 6 million €. The expectation is that by the end of 2008 200,000 SMEs will be supported.

The Energy Centre is financed by the Ministry of Economic Affairs.

---

\(^{24}\) Dutch: Energiecentrum MKB.
II.5 Transport

The following measures apply to the Transport sector:

- Energy Tax (see II.1)
- Energy Investment Deduction (see II.1)
- Long-term Agreements (see II.1)
- Taxes: fuel taxes, motor vehicle tax (Dutch: MRB) and private motor vehicle and motorcycle tax (Dutch: BPM), surcharge levy per kilometre, CO₂-differentiation BPM
- Limiting maximum speed
- Energy labelling of cars
- ‘Eco-Driving’ programme
- Subsidy scheme CO₂ reduction transport
- Longer and heavier lorries
- European car standards
- Distance-based levy for transporters of goods
- Additional taxation of motor fuels which are harmful to the environment
- Discount on tax for most efficient leased cars

</table>

### Category

3.2 Tax rebates and other taxes reducing energy end-use consumption

### Regional application

The Netherlands

### Target group

- Private vehicles and vans and motorcycles
- Transport of goods

### End-use EEI action targeted

Decreasing the use of cars by making car use more expensive (more public transportation, more bicycles, more car pooling), and stimulating the population of acquire lighter and more economic cars.

### Status of implementation and planning

Fuel taxes: since 1990.
Surcharge levy per kilometre: proposed implementation during the period of this cabinet.

### Description

Fuel tax is a consumer tax included in the price of both petrol and diesel. The tax is levied per litre. In 2006 the tax in the Netherlands for Euro lead-free petrol was €0.67 (consumer price €1.46) and for sulphur-free diesel €0.36 (consumer price €1,08). The tax levels have hardly changed in the past years.

On 1 July 2006 the new Private Motor Vehicle & Motorcycle Tax (Dutch: BPM) regulation went into effect. Each new personal vehicle can receive a reduction on the BPM depending on the car’s energy label. The aim of the regulation is to reward economic cars with a bonus on the BPM and to penalise relatively uneconomic cars with a surcharge on the BPM (penalty). The regulation is based on the Dutch system of energy label for personal cars (A to G) that determines the classification of the car according to its relative thriftiness. The government wants to intensify this measure. This probably will be implemented 1 January 2008.
The bonus and penalty amounts are as follows:

<table>

</tbody>
</table>
**Name** | **Limiting maximum speed**
--- | ---
**Category** | 1. Regulation (and Enforcement)
**Regional application** | The Netherlands
**Target group** | Motorway/Road car users
**End-use EEI action targeted** | Imposing a lower maximum speed and enforcing it can influence driving behaviour. Lower speed goes hand in hand with less fuel consumption.
**Status of implementation and planning** | Further limitation of the maximum speed most likely will not go through due to high costs.

**Description**

The maximum speed on Dutch motorways is 120 km/h. Since 2001 the maximum speed has been enforced more strictly. In 2004 and 2005 the maximum speed in many urban areas was lowered from 120 to 100 km/h. In a few urban areas it is even down to 80 km/h. Monitoring maximum speed was tightened by means of trajectory spot-checks.

<td><strong>Status of implementation and planning</strong></td>
<td>Since 2001</td>
</tr>
</tbody>
</table>

**Description**

All new personal vehicles have an energy label. The label provides information about the energy consumption of the car. The label is related to the average emission of all new cars (the CO₂ reference standard). Cars with an A label are the most fuel-efficient cars. Cars with a G label are the least fuel-efficient. Cars with a C or D label have average fuel consumption for their size. There are cars with A or B labels in each 'size category'. A car with an A label definitely uses 20% less fuel than a car with a C or D label in the same size category. The fuel bill for a car with a B label is 10 to 20% lower than the fuel bill for a car that has average fuel consumption for its size.

The addition to the taxable income for leased cars (22% of the purchase price of leased cars must be added to the taxable income) is going to be changed in such a way that leased car drivers are fiscally encouraged to obtain economical private cars.
### Description

The Eco-Driving\(^{25}\) programme encourages holders of driving licences (or aspirant drivers) and car fleet managers to adopt a more energy efficient and safer purchasing and driving behaviour.

The objective of Eco-Driving is to urge car drivers, professional chauffeurs and car fleet managers to adopt a more energy efficient and safer purchasing and driving behaviour. Presently the Eco-Driving programme Phase 3 is being implemented and it shall run from 2006 to 2010.

The information campaign of Eco-Driving is focused on changing driving behaviour as well as the attitude towards buying cars. To influence driving behaviour, an information campaign was started, which focuses on aspects such as driving in low gear and tyre pressure monitoring.

The programme also has a subsidy component intended for municipalities, provinces, companies, sector organisations, dealers, consumer organisations, road safety organisations and parties offering advanced driving lessons. It concerns for example, car equipment and training. The subsidy part is accommodated in the Subsidy regulation for CO\(_2\) reduction in traffic and transportation.

Eco-Driving is a programme put out by the Ministry of Transport, Public Works and Water Management. SenterNovem facilitates implementation.

</tbody>
</table>

**Description**

The subsidy scheme CO2 reduction transport sector\(^{26}\) provides subsidies to companies and organisations carrying out projects to reduce CO2 reduction in transport. The scheme consists of two programmes, one for goods traffic and one for transport of passengers. The subsidy for 1 tonne CO2 reduction is €10.

In the last 4 years 4 programmes have been carried out, each of them with a budget of 6 million €. The following type of projects were subsidised: clean technology and vehicles, transport efficiency, modal shift, alternatives for the private car.

---

\(^{26}\) Dutch: Subsidieregeling CO2-reductie Verkeer en Vervoer.
Name: Longer and heavier lorries

Category: 4.2 (Voluntary agreements and co-operative instruments) Commercial of Institutional Organisations.

Regional application: The Netherlands

Target group: Transport companies

End-use EEI action targeted: Increase energy efficiency of lorries.

Status of implementation and planning: Large scale experiment 2004-2006. First phase (3 to 5 years) starting 1 November 2007.

Description

A longer and heavier lorry[^27], also named Ecocombi, is a lorry that is allowed and able to carry more freight than an ordinary lorry. An Ecocombi is at most 25.25 metre long and has a weight of 60 tonnes, whereas an ordinary lorry is at most 18.75 metre long and has a weight of 50 tonnes (in the Netherlands). Because the fuel consumption of an Ecocombi is only marginally higher than the consumption of an ordinary lorry, transport of goods with an Ecocombi saves 4 to 30 % on fuel (per lorry).

[^27]: Dutch: Langere en Zwaardere Vrachtautocombinatie (LZV).
**Name**  | European car standards  
--- | ---  
**Category**  | 1.2 Minimum Equipment Energy Performance Standards  
**Regional application**  | The Netherlands  
**Target group**  | Car manufacturers  
**End-use EEI action targeted**  | Develop stringent standards for cars, so newly bought cars are much more energy efficient  
**Status of implementation and planning**  | New EEI measure, process of implementation not started yet

**Description**

European standards are crucial for achieving goals on energy efficiency and CO₂ reduction. The Dutch government wants the EU to set a maximum of 120/130 g-CO₂/km in 2012. The Commission has made a proposal for a renewed Community strategy to reduce CO₂ emission from light vehicles (cars and vans) which includes this target. In its work programme, the Dutch government has written its intentions to lower the 130 g/km in 2016 and further in 2020.
Name | Distance-based levy for transporters of goods
--- | ---
Category | 3.2 tax rebates and other taxes reducing energy end-use consumption
Regional application | The Netherlands
Target group | Transport sector
End-use EEI action targeted | Make driving more expensive to limit the kilometres driven.
Status of implementation and planning | New EEI measure, process of implementation not started yet. In discussion, no governmental intention for implementation yet.

Description

Like car drivers, transporters of goods must be charged per kilometre. The fixed taxes for transporters are relatively low in comparison with other costs. Unlike the expected passenger car levy, this levy is not based on a shift from fixed to distance-based taxation.

The system could be comparable to the German *Autobahnbenutzungsgebühr für LKW* (Distance-based heavy load levy)\(^{28}\). In this system the toll rate is based on actual infrastructure costs. These costs are spread over the heavy goods lorries that use the roads. They have to pay a levy for every driven kilometre.

The measure will stimulate transporters to minimize driving distances.

\(^{28}\) See MURE database for a description: [http://www.isis-it.com/data/mure_pdf/transport/GER2.PDF](http://www.isis-it.com/data/mure_pdf/transport/GER2.PDF)
**Name**  
Additional taxation of motor fuels which are harmful to the environment

**Category** | 3.2 Tax rebates and other taxes reducing energy end-use consumption
**Regional application** | The Netherlands
**Target group** | All end users that fall under the scope of the Energy Service Directive (ESD)
**End-use EEI action targeted** | Making investments in projects that have a positive effect on nature and the environment more attractive.
**Status of implementation and planning** | Implemented in 1995: ongoing regulation

**Description**

The all-encompassing term ‘Green Investment’ contains on the one hand the conservation and investment in green projects and on the other hand, green financing. In order to qualify for green financing, the projects require a ‘green declaration’, which demonstrates that the entities comply with certain criteria. Green Investment is made available by means of two directives: the Green Fund Directive and the Green Project Directive.

The Environment Investment Deduction\(^29\) offers entrepreneurs who invest in environment-friendly equipment the possibility to deduct up to 40% of the investment amount from their taxable profits. The percentage of the deduction depends on the environmental impacts and the prevalence of the equipment.

The Accelerated Depreciation on Environmental Investments\(^30\) offers liquidity and interest benefits. Entrepreneurs that adopt the VAMIL scheme for their equipment can write off their equipment arbitrarily or freely.

The MIA and Vamil schemes are two different regulations, but often they are combined. Both regulations use a mutual list, what has become known as the Environment List. This list contains all the types of equipment that qualify for MIA and/or Vamil. The Environment List is reviewed annually.

The glasshouse horticulture industry frequently submits claims for Green Label Glasshouses and semi-closed greenhouses under Green Investment scheme and within the MIA and VAMIL schemes.

- Green Label Glasshouses: glasshouses for commercial growth of garden products with low energy consumption and a low environmental impact.

\(^{29}\) Dutch: Milieuinvesteringsaftrek (MIA).

\(^{30}\) Dutch: Willekeurige afschrijvingen milieu-investeringen (VAMIL).
glasshouses must comply with strict requirements set for the use of minerals, water and energy.

Aspects such as light radiation and organic crop protection also play a role in this. Depending on the number of points that Green Label Glasshouses obtain in the green certificate, they are permitted to participate in MIA/VAMIL and/or Green Investment.

- Semi-closed greenhouses: In the semi-closed greenhouse systems the environment and energy performance are considerable better than in the Green Label Glasshouses, because the emphasis is on applying new techniques and the use of sustainable energy sources. The hot air in these greenhouses is cooled and the heat is stored in aquifers.

**Description**

Various schemes exist to support the development of and investment in energy efficiency measures and efficient energy systems.

The scheme ‘Investments in energy savings’\(^{31}\) offers a subsidy of 25 % of the eligible costs with a maximum of € 400,000 to greenhouse farming companies that implement measures to increase energy efficiency. Also clusters of companies are eligible.

The scheme ‘Market introduction energy innovations’\(^{32}\) aims to stimulate and accelerate early market introduction of efficient energy systems by greenhouse farming companies. Investments in semi-closed glasshouses should result in a CO\(_2\) emission reduction of at least 25 %.

The Unique Opportunities Scheme\(^{33}\) supports projects in which market parties and other stakeholders cooperate towards the transition to a sustainable energy system. Emphasis is put to accelerated market introduction of technologies contributing towards this transition. The scheme subsidizes up to 40 % of the part of the investment that is not cost-effective.

Furthermore financial support of 50 % of the eligible costs is provided to projects that test and show in practice the results of innovations.

The programme Greenhouse as Energy Source\(^{34}\) encompasses a strategy of 6 transition paths leading to a sustainable energy system for greenhouses, meaning that in 2020 new greenhouses should allow for energy neutral cultivation. Several instruments are implemented in this programme, e.g. design competition.

demonstration projects, communication and dissemination of knowledge and financial support. The programme is financed by the Ministry of Agriculture, Nature and Food Quality.
### Name
*Internal emission trading system for the greenhouse sector*

### Category
4.1 Voluntary agreements and co-operative instruments – Industrial companies

### Regional application
The Netherlands

### Target group
Greenhouse horticulture sector, insofar not participating in the emission trading scheme.

### End-use EEI action targeted
Increasing awareness of energy consumption and stimulation of investments in energy-saving measures by giving CO₂ a market value.

### Status of implementation and planning
New EEI measure, process of implementation not started yet. Proposed measure, expected to be implemented in 2010.

#### Description
To improve the energy efficiency of the Dutch greenhouse sector, which is the dominant user of energy in the agricultural sector, a separate CO₂ emission trading system will be set up for this subsector. The cap for the CO₂ emission will be set by the government. By giving CO₂ a market value, companies are encouraged to invest in emission reduction.

The horticulture organization Productschap Tuinbouw is expected to introduce and manage this system, and has proposed a system design. An internal balancing system for the greenhouse sector is expected to be operational in 2010.

Many large greenhouse companies (65 in 2007) already participate in the European Union Emissions Trading System (EU-ETS). The new system will involve also smaller companies into emissions trading. The Netherlands will strive for a coupling of this system to the EU-ETS via a separate construction. It is expected that this can be realized in 2013.
